

The question is:

*There are four cards. Each one has a number on one side, and a letter on the other. They are displayed on a table, and only one side is visible: D, 7, 5, K.*

*Which card(s) should you turn over to test the following rule: "If a card shows D on one face, then its opposite face is 5". You should neither turn a useless card nor forget a useful one.*

When you have a precise answer (ideally written), stop the timer.

Then, you can go back to the article and read the answer and the analysis.
